## Parallel K-Means using Hadoop

#### Members:

- Amr Mohamed Nasreldin Elsayed (47)
- Michael Raafat Mikhail (57)

### Unparallel K-means Pseudo-Code:

```
Function K-means (K: number of clusters, D: dataset of samples):
```

- 1. Initialize k cluster centroid randomly: M(1), M(2), .... to M(k).
- 2. Repeat Until Convergence:
  - a. For every sample i in D:
    - i. C(i) = argmin<sub>i</sub>(ecludian\_distance(D(i) M(j))
  - b. For j from 1 to K:
    - i. M(j) = Mean(any sample i where C(i) == j)
- 3. Return the cluster centroids.

## Map-Reduce algorithm:

```
public static class CentroidReducer extends Reducer<IntWritable, FeatureRow, Centroid, NullWritable> {
    public void reduce(IntWritable key, Iterable<FeatureRow> values, Context context) throws IOException
    int feat = values.iterator().next().getFeatures().size();
        SemiCentroid sc = new SemiCentroid(feat);
        for (FeatureRow val : values) {
            sc.addFeature(val);
        }
        Centroid c = new Centroid(key.get(), sc.getRow(), sc.getPoint_number().get());
        context.write(c, null);
    }
}
```

```
public static class ClusterMapper extends Mapper<Object, Text, IntWritable, FeatureRow> {
    public void map(Object key, Text value, Context context) throws IOException, InterruptedException {
        FeatureRow row = new FeatureRow(value.toString());
        if (row.getFeatures().size() == 0) {
            return;
        }
        int k = Integer.parseInt(context.getConfiguration().get("k"));
        int belongs_to = 0;
        double minDis = Double.MAX_VALUE;
        for (int i = 0; i < k; i++) {
            Centroid c = new Centroid(context.getConfiguration().get("c"+String.valueOf(i)));
            double dist = Utils.calculateEcluidDist(c.getRow(), row);
        if (dist < minDis) {
            minDis = dist;
            belongs_to = i;
        }
    }
    context.write(new IntWritable(belongs_to), row);
}
</pre>
```

#### We make some classes and util class that helps our algorithm:

- Feature Row
- Centroid
- Semi Centroid
- Utils

#### **Challenges Faced:**

- Passing Feature Row per Sample in Mapper:

We decided to parse Text to String that represent value of features per sample, then converting these values to Feature Row.

How to get Initial Centroid:

We decided to set initial centroid from a configuration file

## **Evaluation Results:**

Our Results are nearly the same as using Kmeans in Sklearn library in python.

**Notes:** We formed a jar file for our K-means Algorithm

```
Spin/hadoop jar kmeans.jar KMeans /user/amrnasr/input /user/amrnasr/output/
```
